While you can create, combine, and manipulate layers and colors in other software, if you want to get the most out of Photoshop, you will want to come to grips with layers, transparency, and color. Photoshop's basic editing controls and tools enable you to scale, rotate, flip, and warp images. You can also add special effects and layer masks to create more interesting images. You can also use filters and masks, and put several layers together to create effects such as shadows, highlights, highlights and shadows, and reflections. Figure 5-2 shows how simple the basic editing tools are: The Move tool can be used to move a selected layer or object; the Eraser tool can be used to erase portions of the image; and the Paint Bucket tool can be used to fill in selected areas with one of the available colors. Photoshop also contains tools that allow you to create selections. A selection is a rectangular area of an image that you can move to another part of the image and manipulate without affecting other parts of the image. The Grid tool can be used to measure image areas in a grid format. The Snap tool can be used to align a layer to the edges of the picture or to an existing layer or object. Photoshop also contains a 2D Transform tool that, in conjunction with the Move tool, lets you position, scale, rotate, flip, and skew (move along the x and y-axes) the image around a central point. You can also distort the shape of an object by using the Warp tool (see the next section). **Figure 5-2:** The Move tool (top), Eraser tool (center), and Paint Bucket tool (bottom) are relatively basic, but can handle a lot of detail. Scaling images Scaling an image is necessary when you want to make the subject look smaller or larger than the actual image. Scaling is most often used to compress an image or to create the illusion of greater distance in an image. To scale an image, follow these steps: 1. Open the image you want to scale in Photoshop. 2. Choose Image⇒Image Size to open the Image Size dialog box, as shown in Figure 5-3. 3. Click the Horizontal Size button and enter an X value in the box that appears. The X value determines the scaling factor for the horizontal direction. A lower X value gives the image

What's New in the Adobe Photoshop 2020 (version 21)?

Q: Why is [which database?] closing in on [database?]? This has been bugging me for months. I run the following query, which returns a lot of irrelevant data. select * from (select'recovered data' as the_value from dual union all select 'not recovered' from dual union all select 'used data' from dual union all select 'unused data' from dual) q1 I get a lot of rows, each with the same value: the_value ------------------ recovered data recovered data recovered data not recovered used data The id variable is an integer. The records have no duplicates. I expect to receive no rows, but I'm getting a lot of them. The total number of rows is very low (one row), but they're being returned in this order: 1 5 10 11 42 43 The output looks "pre-ordered", which makes me suspect that it's non-random but I can't see any pattern. I'm almost certain that this question is asked a lot, but the explanations I find don't quite cover this. A: The rows are being ordered by the value. Here is a little example: SQL> select * from (2 select'recovered data' as the_value 3 from dual 4 union all 5 select 'not recovered' 6 from dual 7 union all 8 select 'used data' 9 from dual 10 union all 11 select 'unused data' 12 from dual 13) q1; THE_VALUE ------------------ recovered data recovered data recovered data not recovered used data unused data 10 rows selected. SQL> select * 2 from (3 select'recovered data' as the_value 4
